Oklahoma Oil and Gas Fields (Distinguished by GOR and Conventional Gas vs. Coalbed Methane) .....	in envelope
--	-------------

This publication, printed by Pikes Peak Lithographing, Colorado Springs, Colorado (map) and by the Oklahoma Geological Survey, Norman, Oklahoma (booklet), is issued by the Oklahoma Geological Survey as authorized by Title 70, Oklahoma Statutes 1981, Section 3310, and Title 74, Oklahoma Statutes 1981, Sections 231–238. 5,000 copies have been prepared for distribution at a cost of \$31,126 to the taxpayers of the State of Oklahoma. Copies have been deposited with the Publications Clearinghouse of the Oklahoma Department of Libraries.

# Oklahoma Oil and Gas Fields

## (Distinguished by GOR and Conventional Gas vs. Coalbed Methane)

DAN T. BOYD

Oklahoma Geological Survey

### Introduction

This map is an update of the Oklahoma Geological Survey's *Map of Oklahoma Oil and Gas Fields* (GM-28), which was completed by Margaret R. Burchfield in 1985. Like GM-28, this map displays the areas in Oklahoma that have produced oil or gas (or both), with no distinction drawn between producing, non-producing, active, and abandoned fields. Field boundaries are provisional and include previously unassigned wells recommended by the author for inclusion within the expanded outlines shown on the map.

Field colors are based on gas-to-oil ratio (GOR), with coalbed methane (CBM) distinguished from conventional gas. GOR is expressed in standard cubic feet of gas per barrel of oil. Oil (map areas in green) production is shown for fields with GOR less than 5,000, oil and gas (brown) for fields between 5,000 and 20,000, and gas (red—conventional; pink—CBM) for fields with GOR greater than 20,000. Calculations are based on cumulative production since 1979 and combine condensate with oil and associated gas with non-associated gas. (State production data prior to 1979 have been lost.)

The table on the map sheet lists all recognized fields in Oklahoma. An alphabetically assigned OGS number distinguishes each field. To aid in identifying a field, a single centrally located township is also listed. Major fields—defined as having produced at least 100 million barrels of oil or 1 trillion cubic feet of gas (or both), or being larger than one township (36 square miles)—are shown in the table in boldface type. For more information about recognized and obsolete fields, see Tables 1, 2A, and 2B.

### Data and Nomenclature

Recommendations resulting from this study have been made to the Nomenclature Committee of the Oklahoma Corporation Commission, which is responsible for official assignment of field boundaries. The committee assigns producing leases to fields, and its assignments are maintained in the Natural Resource Information System (NRIS) database, which is operated by Geo Information Systems (a department of the University of Oklahoma). Although NRIS is a repository for much of the State's oil and gas data, the only information used to construct this map concerns the coordinates for leases assigned to fields and the field's production since 1979. All the recognized fields listed in the NRIS database are shown on the map, including those that appear to need revision. This includes fields labeled "old", those located incorrectly, or those with two names for the same field. It also includes

tiny, combinable fields that touch or overlap larger fields in areas where the rules of the Nomenclature Committee forbid contact or overlapping. Data in need of review have been identified, cataloged, and prioritized to help the Nomenclature Committee revise the State's database.

On the map, CBM fields are distinguished from conventional gas fields by color. Their identification-number series begins with 4000; the names and numbers are italicized, and in the table "CBM" is appended to the field name. Data on the location of CBM wells are from Brian J. Cardott of the Oklahoma Geological Survey. His database includes all CBM completions, compiled from well-completion reports (form 1002A) submitted to the Oklahoma Corporation Commission. The database, complete through April 2002, represents more than 1,600 wells. At present, the Nomenclature Committee is placing CBM wells in countywide gas areas bounded by county lines. In order to identify CBM fields in a manner similar to that used for all other fields in the State, the CBM field names on this map are based on recognized conventional field names at or near where the fields occur. If more than one CBM field is present within an existing field outline, the CBM fields are distinguished by the letters A, B, C, and D, reading from west to east. The names have been recommended for formal assignment; however, neither the names nor the method for determining them has yet been considered by the Nomenclature Committee.

Three tables accompanying this discussion supplement the table on the map sheet. Table 1 lists the currently recognized field names in the NRIS digital database and also those that have been added as a result of this study. In addition to the OGS code, it shows the national field code assigned by the United States Department of Energy. Fields that have been officially abandoned are indicated with the letter "A". (Many fields that have not produced for extended periods are not yet officially considered abandoned.) "Location" refers to the central township and the primary county in which the field occurs. In the range column, "C" is an abbreviation of ECM (east of the Cimarron Meridian) and applies to areas in the Panhandle. Hydrocarbon type ("HC type") is based on the GOR and corresponds to the oil, oil and gas, gas (conventional), and CBM fields depicted on the map.

In Tables 2A and 2B, field names shown as obsolete have been replaced and hence have no OGS code number. They have been sorted by their original (obsolete) names in Table 2A, and in Table 2B by the names currently recognized. Under "Alias", abbreviations show how the original names were converted into those recognized in Table 1: "C" indicates that the field was combined with

a larger field; "R" that the field was renamed—usually where a large, combined field or trend was renamed for the original discovery. "O" refers to an old name that was changed, but for which there is no revised name. "L" refers to an alternate name that is no longer in use, but a revised name does exist. (This designation sometimes is used to correct spelling errors.) "S"—for "Split"—is used where a larger field has been divided into smaller fields, each of which requires a separate name.

In Tables 1, 2A, and 2B, the discovery date for each field is shown if it is known. The first four digits refer to the year, the next two the month, and the final two the day. If the last four digits are 9999 the discovery month and day are not known. Discovery dates in Tables 2A and 2B apply to the original (now obsolete) fields, not the fields into which they are now included. A blank space indicates that the discovery date is unknown.

### Map Construction

Field outlines on the map were drawn and smoothed in order to include every well that has ever produced oil or gas into an unnamed, CBM, or previously recognized field. Wells included in leases not yet assigned to fields were identified by comparing the productive lease boundaries in the NRIS database to Herndon Map Service maps current through October 2001. For the northeastern part of the State, where Herndon maps are not available (northeast of T. 15 N., R. 13 E.), unassigned wells were identified using an NRIS base map displaying all wells recorded in the database.

For each field a general outline was drawn with a computer-mapping program (ArcView 3.2), encompassing the leases already assigned to the field. Unassigned wells were placed in fields based on their proximity and were added, where possible, to preserve existing production trends. Although recommendations have been made to combine smaller fields into other fields, all fields have been kept separate pending review by the Nomenclature Committee. Many one-well fields are shown larger than their actual lease boundaries so that they can be seen more easily at the scale of the map. Because each field is depicted as a single outline (i.e., none of the fields have holes), small unproductive areas within larger fields may be shown as productive. In areas where unassigned wells

are more than about 1.5 miles from an existing field, an unnamed field is shown.

Because most of Oklahoma's oil and gas fields are defined geographically and not by reservoir, the size and shape of most fields depend more on discovery and development history than on the geology. Many fields have primary reservoirs, but most produce from several different stratigraphic intervals. Because the bulk of Oklahoma's production comes from stratigraphic traps, field boundaries generally do not conform to well-defined geologic structures. For that reason, as reservoirs are added—each with its own distinct orientation and trapping style—the combined field is enlarged and its shape becomes progressively more irregular. As these large, combined fields expand and merge, depiction of their boundaries becomes somewhat arbitrary; that is why some outlines follow section or township lines. In areas where production becomes contiguous, interlocking field boundaries are drawn parallel to each other, with a slight gap in order to distinguish the outlines of individual fields.

Stacking of fields is permitted in areas of regional gas production—the Panhandle, Kay County, and all CBM areas. That makes clear depiction of field boundaries difficult in those regions. In areas of CBM production, the overlap is represented on the map by a pink outline on top of conventional production. In the Panhandle the overlapping Mocane-Laverne, Guymon-Hugoton, and Camrick Gas Areas are distinguished by distinct, bold boundary lines. Wherever possible, labels are printed inside field outlines, with the font size roughly proportional to the size of the field.

As the Oklahoma Corporation Commission has jurisdiction only within the State, field outlines cannot be shown extending into other areas. However, where field outlines follow the Oklahoma boundary, it can be assumed that production continues into the adjoining State (Texas, Colorado, Kansas, Arkansas).
